Problem Statement

Many organizations rely heavily on data-driven insights to improve decision-making, optimize operations, and enhance customer satisfaction. The classicmodels database, containing information across multiple dimensions such as customers, products, productlines, orders, payments etc., provides a rich source of data that can reveal patterns and trends related to sales performance, customer behavior, and supply chain efficiency.

However, the challenge lies in effectively analyzing this large and multidimensional dataset to extract actionable insights. Without proper analysis, businesses may struggle to identify their best-selling products, understand customer purchasing patterns, evaluate supplier performance, or detect inefficiencies in order fulfillment.

This project aims to perform comprehensive data analysis on the classicmodels database to uncover valuable insights that can guide strategic decisions. The analysis should focus on answering key business questions such as:

- Which products generate the highest and lowest revenue?
- Which product lines result in highest revenue?
- Who are the top customers, and what are their purchasing behaviors?
- How do seasonal trends and order volumes vary over time?
- How status of orders affecting purchases?
- Understanding employee contribution in processing orders?
- Whether credit limit of customers affecting purchase?

Please create 3 or more business questions of this type and analyze. Analyze and answer at least 10 questions

Finally, you need to provide insights and analysis to get complete understanding of sales performance, customer purchases, and supply chain reliability, ultimately leading to data-driven strategies for growth and optimization.

Please share the query, share the screenshot of result set and give insights and strategy for all the business questions as part of submission.
